Abstract. Recent urban morphology studies consider urban tissues as living organisms changing in time (Strappa, Carlotti, Camiz, 2016), following this assumption the urban morphology theory should examine more analytically what Muratori called 'medievalisation' (Muratori, 1959), a term describing some of the transformations of urban routes happened in the middle ages. The paper considers the diachronic deformation of routes, and other multi-scalar occurrences of the attraction phenomena (Charalambous, Geddes, 2015), introducing the notion of attractors and repellers. Archaeological studies already do consider attractors and repellers as a tool to interpret some territorial transformations, following the assumption that “the trajectory that a system follows through time is the result of a continuous dynamic interaction between that system and the multiple ‘attractors’ in its environment” (Renfrew, Bahn, 2013, p. 184). There are different elements that can act as attractors in an urban environment, such as bridges, city walls, city gates, water systems, markets, special buildings, and it is possible to consider each of these anthropic attractors as equivalent to a morphological attractor at the geographical scale. We can even interpret the ridge-top theory (Caniggia, 1976) as the result of attraction and repellence of geographic features on anthropic routes. The territorial scale analysis is the methodological base of the theory, but the attractors herein considered operate at the urban scale, deviating locally across time from a rectilinear trajectory and defining a specific urban fabric. The research interprets and reads the effects of attractors on urban routes and fabrics as a method for the reconstruction of Nicosia’s medieval city walls, in continuity between the Conzenian approach (Whitehand, 2012) and the Italian School of Urban Morphology (Marzot, 2002).

Keywords: Attractors, repellers, urban routes, urban morphology, theory, history.

“He maketh me to lie down in green pastures: he leadeth me beside the still waters”
Psalm 23, 2, KJV.

Introduction

The attractor theory is a new experimental tool of analysis in the urban morphology field, introducing a diachronic analysis of the configuration of routes. Routes change in time and we can interpret some of the deformations they follow as the result of the attraction or repellence of certain artefacts, defined here as attractors or repellers. Once an attractor appears into an urban network of routes, it may happen that some paths change their configuration and deviate from their former position. Archaeological studies have introduced the same notion of attractor and repeller as a tool to interpret some territorial transformations, following the assumption that “the trajectory that a system follows through time is the result of a continuous dynamic interaction between that system and
the multiple ‘attractors’ in its environment” (Renfrew, Bahn, 2013). Mathematicians also use the notion of attractor with a quite different meaning, as a set of numerical values toward which a system evolves in the long term. There is a number of studies on urban planning deriving the notion of attractor from the mathematical concept and applying it to the statistical study of settlement patterns. (Boeing, 2016). Some archaeologists have borrowed the theory of attractors from mathematics to explain cyclical or “strange” transformations using the point, limit cycle, toroidal, strange attractor division (McGlade, 1995), (McGlade, Van Der Leeuw, 1997). Space Syntax studies have introduced the term attractor to name an element attracting pedestrian movement; and other connected concepts such as the spatial layout attraction, the land use attraction and the transport attractions. In this discipline, an attractor is a building or any other feature with the potential of generating trips to and from a place. A negative attractor is instead an element decreasing the natural movement rates. (Hillier, Penn, Hanson, Grajewski, Xu, 1993). The attractor as defined in Space Syntax differs from the one we are introducing here but is useful for the explanation of the theory, as it refers to pedestrian movement, which happens usually before the street itself is built. The traffic may therefore influence the planimetric shape of a route as attracted in time. The route, street or lane is a human artefact and we can study it just like buildings and urban tissues. Moreover the level of permanence of routes is in general higher than that of buildings, while the most buildings are private (base buildings) and only few are collective (special buildings), routes instead are in general public and should be considered as collective artefacts. In the long term, streets can tell much more history than buildings.

Methodology

The object of this research is the analysis of the planimetric configurations of streets in urban environment, recognising typical configurations, and their diachronic transformations due to the effect of the attractors. This analysis can be useful for different disciplines, such as archaeology, urban history, and urban planning. We can define an attractor as an element that deviates a route from its previous configuration by attracting its traffic. A repeller is the inverse of an attractor, an element deforming the configuration of a path by repelling its traffic. An attractor now not existing anymore may be inferred with the formal analysis of the configuration of routes that have been attracted by it, determining a sort of diachronic urban stratigraphy. It is therefore possible to infer the presence, type and position of a former attractor by recognising the deformations of the routes that were attracted by it. In case of disappearance of an attractor or repeller, the configuration of the routes modified can return to its former position or not, depending on the presence of other urban elements preventing its elasticity, as built urban tissues, or even property divisions. I absence of any retaining other structure, once the attraction ceases the route goes back to its undeformed shape. Considering that every route pre-exists its settlement (Caniggia, 1963), the planimetric form of the route depends on a number of elements attracting and repelling its course from the shortest path. These elements, defined here as attractors and repellers, can appear, disappear, or even change position in time, determining through history the complex configuration of the route itself. The changing positions of the attractors and the changing strength of attraction can be recognised and used to interpret the phases of an urban settlement. Once an attractor ceases to exist or ceases to attract, it may happen that the route returns to its unattracted configuration, but in urban areas, urban tissues reduce this elasticity limiting the possibility of reversing the attraction phenomena, freezing therefore the attracted configuration. As a first classification based on the observation of different case studies we considered point attractors, continuous attractors, and shaped or areal attractors. Examples of point attractors may be wells, city gates, bridges, fords, springs, and mountain passes. Examples of continuous attractors are instead city walls, rivers, seashores, lakeshores, canals, while shaped or areal attractors are buildings, infrastructures,
rock formation, lakes. Attractors can be territorial or urban: some special buildings or urban functions may act as attractors, typically, markets, power seats (government buildings, local administration buildings), churches, monasteries, other religious buildings. The only difference between a territorial and an urban attractor is the urban environment, as a city may significantly change in time. A territorial attractor in a subsequent phase may find itself inside a city, and on the other hand, what was once an urban attractor could today be in an abandoned territory becoming thus territorial. Distinguishing between nodal and polar attraction, includes the notion of pole/antipole and node as defined in the Muratorian theory (Caniggia, Maffei, 1979). The attractor itself is not nodal or polar, but the attraction point can be nodal or polar in relation to how the different routes are converging there, a nodal attractor is determining a branching between two or more routes, while a polar or antipolar attractor determines the origin or destination of a route. Attraction can be deformed or undeformed, where a deformed attraction is visible in the local modified configuration, while routes that don’t have a local curvature converge in an undeformed attractor. Attractors and repellers can be simple or complex depending on how the effects of their action are classified, either in a simple form or as the result of different forms merged together. Finally attractors and repellers can be simple or complex depending on how the effects of their action are classified, either in a simple form or as the result of different forms merged together.
repellers can be anthropic or natural, depending if they are determined or not by human action. This classification is tentative, and is based on the observation of the attraction phenomena in the urban and territorial environments. The classification is useful to build a taxonomy of attraction cases, based on a binary set or parameters, and to recognise the attractor type. So following the classification there could be an anthropic point nodal undeformed simple attractor, as well as a natural continuous deformed complex attractor. The main characters that need to be recognised in the road network, besides the road curvature and inflection, are the discontinuities in the track, the bifurcations, the intersections and the convergences.

**Measurement and analysis**

Looking at the variations of urban tissues for different site morphologies (figure 1) (Caniggia and Maffei, 1979), we understand that the urban routes and therefore the urban tissues are strongly affected by the morphology of the site, as if the site was acting like an attractor. Nevertheless, it is not possible, if not in a geological time scale, that the changing morphology of a site affects and deforms the configurations of the routes. Therefore, the attraction of a natural attractor is permanent and not very useful to reconstruct diachronically the changes of the routes. Anyhow the shortest path from one point to another on a flat surface is a straight line, if the surface has a complex form instead the patch tends to follow the minimum energy path. In this case, the morphology of the site acts as an attractor to the route, deforming its theoretical straight shape. The first step in the construction of the theory consists in the classification of the natural attractors. The theory is based on the assumption that every anthropic attractor has an equivalent natural attractor. There are different elements that can act as attractors in an urban environment, such as bridges, city walls, city gates, water systems, markets, special buildings, and it is possible to consider each of these anthropic attractors as equivalent to a morphological attractor at the geographical scale. We can even interpret the ridge-top theory (Muratori, 1959) as the result of attraction and repellence of geographic features on anthropic routes. Even the fringe belt phenomenon can be described as the attraction of the city on the urban services together with the repellence of the built urban issue on their localisation (Whitehand and Morton 2006), (Maretto, 2009). The territorial scale analysis is the methodological base of the theory, but the attractors herein considered operate at the urban scale, deviating locally across time from a rectilinear trajectory and defining therefore a specific urban fabric. A natural point attractor is as an example a ford: the position of the ford, which is in general independent form the morphological configuration of the territory, will deviate the routes following the ridge top theory so to cross the river in that specific point. The equivalent anthropic attractor is a bridge. While the ford in the human time scale probably does not change, and the deformation of the route from its theoretical shape is stable, in the case of the bridge, its existence and position can vary in time, so the deformation of the routes can be dynamic. Following the analogy between the mountain pass and the city gate, it is possible to recognise the typical feature of the bifurcation...
of routes converging from the territory to the city gate. This Y shaped bifurcation (Figures 5 and 6) happens when the construction of new city walls and gates, forces a pre-existing street leading to the city centre to abandon its configuration and merge outside of the city entrance with the other route that attracted the construction of the gate in that position. In this case, one of the routes is acting as an attractor for the position of the gate, and subsequently it is the gate acting as point attractor to the other routes. Therefore, it is possible to distinguish an undeformed route merging into the bifurcation, and a deformed one. We can recognise this configuration in the bifurcations outside of Porta Ravegnana in the medieval Bologna, in this case the Kardo of the roman Bononia, via Aemilia, continues undeformed outside of the roman city walls, while the other routes were attracted converging in the gate. The same phenomenon can happen inside the city, either because the urban tissue is not consolidated yet or with the restructuring of the former urban tissue. A good example of an inner bifurcation of routes for the city gate acting as attractor may be found in Porta del Popolo and the three streets via del Babuino, via Lata and via Ripetta. In this case the via Lata is the unattracted route, the other two, as determined in the XVI century with the Piano Sistino, were designed to converge in the square facing the city gate inside the city. By finding typical configurations of road bifurcations, branching, intersections, and deformations from the straight form, interpreted diachronically, it is possible to construct an abacus of the attractors and repellers, and the deformations caused on the urban routes. With the analytical understanding of a very large number of cases and their explanation in theoretical terms, it will be possible to provide a substantial aid to the study of the history of cities in the middle ages: a historical phase of history that usually lacks documentation for the reconstruction of the urban environment. Recognising these deformations can help us to reconstruct as an example a bridge now not existing anymore. Another natural point attractor is the mountain pass, and its anthropic equivalent the city gate. The linear attractor is instead a continuous structure deforming a route to follow it. Natural continuous attractors are mountain ridges, riversides, lake and seashores. By generalising the ridge top theory, we can say that routes within certain conditions take the shape of the continuous attractors. In some cases, the same element attracting can act as a repeller for other routes. As an example we can consider the ridge top that attracts the route, but if too sharp and steep, deviates the route from its edge (repeller) keeping it though close to it (attraction). City walls are an example of a complex attractor,
as generally they attract the paths inside the precinct to follow their perimeter, and instead repel the former path to follow their perimeter on the outside. The city gate instead acts as a point attractor for the inside and outside routes. Very often the position of the gate is attracted by one of the existing routes on the moment of its foundation, while in a second phase the routes tend to converge in the gate ending with the bident or trident configuration. The very same configuration happens usually with a bridge over a river, where the two valley bottom routes on either side of the river are attracted and deformed by the river’s shape that can indeed change in time, and the routes converge in the position of the bridge. Figure 5 and 6 are an attempt of categorising the attraction phenomena, and describe in time some cases. The diachronic evolution of a path for the appearance of a point attractor A close to the path is described in the first case. The trajectory of a route from pole 1 to antipole 2 is the shortest path in the time T0; in T1, the point attractor A appears and in T2 it inflects the linear trajectory of the shortest path determining inflection points f1 and f2. It is possible that the bifurcations b1 and b2 appear in T3 as the inflected path takes the role of an alternative course (Figure 5, SA1). The behaviour of the path in case of a repeller R, is not symmetrical as the point repeller R along the path deflects the linear trajectory of the shortest path determining the inflection points f1 and f2 but there are 2 distinct alternatives in the trajectory to avoid the repeller, determining a bifurcation (Figure 6, SP1). The medievalisation as explained by Caniggia (1976), can be interpreted as the persistence of attraction of the street corners, while the street is repelled by the growing urban tissue (Figure 6, CP1). While the diagonalisation (Caniggia, 1976) can be described as the existing precinct of the forum acting as a repeller, and after disappearing the streets take the shortest path as attracted by the block corners acting as attractors. (Figure 6, CP1).

Conclusion

The research interprets and reads the effects of attractors on urban routes and fabrics as a method for the reconstruction of Nicosia’s medieval city walls. An ongoing research is
Simple and complex attractors, diachronic transformation of urban routes (drawing A. Camiz).

aimed at the reconstruction of the different phases of Nicosia City walls, from the byzantine “circla”, to the later teichokastron, and the walls built by the Lusignans in the XIV century, comparing them with coeval cases for each phase, such as Bononia (Guidoni, Zolla, 2000), the territorial routes around Cagliari (Cadinu, 1998) and the city of Como (Caniggia,
1963). The reconstruction is based on the cross matching of historical sources, archaeological evidence and the Muratorian (Strappa, Ieva, Dimatteo, 2003), (Cataldi, Maffei, Vaccaro, 2002), (Ieva, 2015) urban morphology analysis methods: this case study was experimentally proposed for the development of the theory of attractors. The research on the medieval
City and territory in the Globalization Age  Conference proceedings

walls is not finished yet, so cannot be entirely presented here. Some preliminary considerations on the topography of Nicosia can be discussed as a first application of the theory. The urban settlement of Nicosia started as Ledra in Bronze Age on the top of Agios Georgios hill, next to the river Pedieos (Kanli Dere), along the intersection of the valley route following that river, and the cross-valley route connecting the Pentadaktulos ridge and the Troodos ridge, and developed as an exchange point between the two sides of the river. Only in Byzantine times, in the X century, the city became the capital of the island, and a surrounding wall was added. After becoming archbishopal seat in 1212, the city grew larger. Nicosia was protected since Byzantine times by a walled enclosure of which very little is known. Later the city was defended by a castle built by Henry I in 1211. A complete city wall surrounding the city was started in 1368 by Peter I and completed by Peter II in 1380. Further works were accomplished by Janus I in 1426, and planned in 1450 following Nicholas V decision. The urban area reached a circumference of four miles, before the Venetian transformation of the city, reduced it to three miles (Mariti, 1792). In 1567 new walls, designed by the Venetian engineers Giulio Savorgnano and Francesco Barbaro, replaced the medieval ones. The construction of the new walls implied the destruction of the older walls, and the infilling of the river, moving its waters into a new moat surrounding the new city walls. A new urban tissue gradually replaced the riverbed, flanked by the sinuous streets that followed its former course inside the ancient city. In Nicosia the three existing bridges, where crossroads connected the two sides of the city, maintained their polar role after the river infilling. The Venetians might have not completed this urban transformation, hence the Ottoman siege of the city in 1570, but in continuity with the precedent administration the Ottoman renovation of the city, used some of the areas above the infilled river. Since then, this area become the city centre. The three bridges disappeared from the urban landscape once the river was infilled, but their trace is still readable in the network of urban routes. The bridges acted as attractors for the urban routes. The crossing point of a river determined by a bridge or a ford, acts definitely as a point attractor for the surrounding existing routes. What is singular is that the Ledra Street check point, the only crossing point of the buffer zone within the walled city of Nicosia, was opened in the same point were in ancient times one of the three bridges was; so the permanence of urban traces acted as a guide for the modern design process. After the opening of the checkpoint in 2008, in the same position of the ancient bridge, all the commercial activities of the walled city of Nicosia were attracted along that same urban axis of Ledra Street, showing a singular cyclical continuity in the attraction phenomenon. In the plan of Nicosia, it is possible to recognise through the inflection and bifurcation analysis a number of meaningful cases. We will propose just a few here, due to the lack of space. The construction of the Kyrenia gate in the end of the XVI century, seems to have attracted the urban axis stemming from the third Royal Palace built in Lusignan times. Maybe in that time the urban tissue was not completed in that zone, and the palace within a fringe belt, was built at the limit of the built area. What is clearly visible in the plan is the attraction of the gate in relation to the urban route, as if the direction of the route was determined by the gate, so to infer that the route developed after the XVI century. In the same area it is possible to hypothesize the presence of a continuous attractor, surrounding the urban tissue, such as a city wall or a moat. On the western side of the city walls, the now called Paphos gate, inflects and bifurcates the outer routes, where the southern one is also deformed by the bastion, acting in this case a repeller. The opening of the Limassol gate in modern times the southern part of the Venetian city walls, attracted the outside routes, and was attracted by the internal ones (Fig. 4). The analysis of a high number of cases of attraction and repellence in urban routes can lead to the further understanding of the diachronic transformation of streets in an urban environment and constitute an instrument for the reconstruction of the different historical phases of an urban settlement, determining the position of city walls, city gates, bridges and other public building.

The social structure and physical form of the state-owned farm in north-east China
Hongpeng Fu, Xiujie Li, Meng Yang

Between territories: Incremental changes to the domestic urban interface between private and public domains
Agnieszka Wir-Konas, Kyung Wook Seo

Understanding cycling in Quito through the lens of social practice theory
José Antonio Vivanco

Clothing consumption practice and its impact on the transformation of “public space”. Vía primavera, El Poblado, Medellín
Natalia Uribe, Diana Carolina Gutierrez

Reading Nablus’ urban print: Towards an understanding of its morphology
Muath Taher, Jorge Correia

Urban sprawl and citizen participation. A case study in the municipality of La Pobla de Vallbona, Valencia
Eric Gielen, Yaiza Pérez Alonso, José Sergio Palencia Jiménez, Asenet Sosa Espinosa

Void of Power
Francesco Mancini, Tanja Glusac

Rethinking urban design problems through morphological regions: Case of Beyazıt Square
Ezgi Küçük, Ayşe Sema Kubat
Obsolescence of urban morphology in the historic center of Villena (Spain). Spatial analysis of the urban fabric in the ISUD/EDUSI candidature
Fernando Miguel García Martín, Fernando Navarro Carmona, Eduardo José Solaz Fuster, Víctor Muñoz Macián, María Amparo Sebastià Esteve, Pasqual Herrero Vicent, Anna Morro Peña

Practices and forms of open space at territorial scale: A comparison between Matera and Valencia, two cities crossed by minerals rivers
Maria Lucia Camardelli, Maria Valeria Mininni, Adolfo Vigil

Urban form and the social use of space
Jorge Iribarne

Study of morphological structures of historical centres as a basic toll for understanding the new conditions of social habitat. Quito, Siracusa and Suzhou
Andrea Gritti, Veronica Rosero, Juan Carlos Dall’Asta, Daniele Rocchio, Riccardo Porreca, Franco Tagliabue

The urban form in the city of Tulcán, Carchi - Ecuador
Yolanda Tapia, Adolfo Vigil, María Dolores Montaño

DiverCity: Urban perception of sociocultural minority groups
Katharina Lehmann

Evolution of the urban form in the British new towns
Julia Deltoro, Carmen Blasco Sánchez, Francisco Martínez Pérez

3. Reading and regenerating the informal city

Towards informal planning: Mapping the evolution of spontaneous settlements in time
Maddalena Iovene, Graciela Fernández de Córdova, Ombretta Romice, Sergio Porta

The changing pattern of urban form: Example of Tripoli, Libya
Almabrok Alkahal

Vincenzo Buongiorno

Central Lancashire New Town: The hidden polycentric supercity
Victoria Jolley

Urban Art and place. Spatial patterns of urban art and their contribution to urban regeneration
Maria Laura Guerrero Balarezo, Kayvan Karimi
Land regularization and quality urban spaces
Ana Paula Seraphim, Maria do Carmo Bezerra

The diagonal city: Crossing the social divisions
Roberta Gironi

4. Efficient use of resources in sustainable cities

A quest to quantify urban sustainability. Assessing incongruous growth
Malgorzata Hanzl, Lia Maria Dias Bezerra, Anna Aneta Tomczak, Robert Warsza

Optimal urban density for a carbon free city in different climates
Udo Dietrich, Hsiao-Hui Chen

Pilot studies on optimizing land use, building density and solar electricity generation in dense urban settings
Zhongming Shi, Shanshan Hsieh, Bhargava Krishna Sreepathi, Jimeno A. Fonseca, François Maréchal, Arno Schlüeter

Making the most of daylight in town planning
Bengt Sundborg

Environmental and energetic operation in “El Ensanche” of Valencia
Juan Colomer Alcácer, Ana Portalés Mañanós, David Urios Mondéjar

5. City transformations

Contribution of planned built environments to city transformation: urban design practice in Montreal from 1956 to 2016
François Racine

Establishing the political and economic power through public buildings: Analysis of ministry buildings in Ankara, Turkey
Ezgi Orhan

From the so-called Islamic City to the contemporary urban morphology: The historic core of Kermanshah city in Iran
Sahar Pakseresht, Manel Guàrdia Bassols

The role of plots and building types in the morphological research of Chinese traditional village tissues
Guo Pengyu, Ding Wowo

Assessment of the process of urban transformation in Baghdad city form and function
Mazin Al-Saffar
Influence of energy paradigm shifts on city boundaries. The productive peripheries of Madrid
Carlota Sáenz de Tejada Granados, Eva J. Rodríguez Romero, Rocío Santo-Tomás Muro

Urban contrast of two cities from globalization. Gentrification, socio-cultural and economic aspects in Mexico and Valencia
María Guadalupe Valiñas Varela, Arturo España Caballero

Intensive residential densification: Impact on the urban morphology of Santiago de Chile
Magdalena Vicuña

Urban morphology in China: origins and progress
Ming Liu, Feng Song

Henri Prost in Istanbul: Urban transformation process of Taksim-Maçka Valley (Le parc n°2)
Pelin Bolca, Rosa Tamborrino, Fulvio Rinaudo

Urban morphology and sustainability. Towards a shared design methodology
Marco Maretto, Barbara Gherri, Greta Pitanti, Francesco Scattino

Plot structure and housing form: Pierre Le Muet vs Athanasio Genaro
Luis Alonso de Armiño Pérez, Gonzalo Vicente-almazán Pérez de Petinto, Vicent Cassany i Llopis

Geometric and poliorcetic inertia in the fortified system vs urban morphological inflections in 18th-Century Barcelona
Juan Miguel Muñoz Corbalán

A first approach to the possible urban form of the city of Alcoy for the 21st century
Ivo Vidal Climent, Ciro Vidal Climent, Vicente Vidal Vidal

Research of the morphological types of urban blocks in the old city of Nanjing
Haiqian Liu

Second life of great American parking garages: Exploring the potential of adaptive reuse of urban parking structures in the American cities
Ming-Chun Lee, Manasi Bapat

City-like settlement to industrial city:
A case of urban transformation in Huwei township
Chih-Hung Chen, Chih-Yu Chen

Urban traces: revitalization strategies for abandoned villages
Letizia Gorgo, Gloria Riggi

The morphological approach in the reading of the territorial city
Maria Gagliardi
Redefining the Smart City concept: the importance of humanizing ‘Intelligent’ cities
Raquel Pérez-del Hoyo, Megan Claire Lees

Altea Urban Project: An academic approach to the transformation of a coastal Spanish touristic city based on the improvement of the public space
Vicente Iborra Pallarés, Francisco Zaragoza Saura

The intervention of Víctor Eusa in the 2nd Ensanche of Pamplona: The artistic transformation of a technical model
Andrés Caballero Lobera

A configurational perspective on the transformation of small and medium-sized historical towns in Zhejiang, China
Ye Zhang, Xiangya Xie, Jie Zhang

Re-reading morphological concepts to face globalization: using typomorphology to excavating modern and contemporary forms
Mazyar Abaee

Nova Imago Urbis: the transformation of city walls in early Renaissance as a model to recover the image of contemporary city
Aritz Díez Oronoz

Building a timeline, developing a narrative: visualizing fringe belt formation alongside street network development
Ilaria Geddes, Nadia Charalambous

The impact of bridges on spatial transformation of urban pattern: The case of Golden Horn, Istanbul
Demet Yesiltepe, Ayse Sema Kubat

Urban compactness and growth patterns in Spanish intermediate cities
Carlos Jiménez Romera, Agustín Hernández Aja, Mariano Vázquez Espí

Irina Kukina

Development of urban areas of the Russian Federation on the Trans-Siberian Railway
Evgine Petrosyan, Ekaterina Kilina

The heritage of the Modern Movement in the conformation of the city. The Casa Guzmán of Alejandro de la Sota
Alberto Burgos Vijande, Teresa Carrau Carbonell

Linear Parks understood as vertebration instruments of the city
Ignacio Bosch Reig, Luis Bosch Roig, Valeria Marcenac, Nuria Salvador Luján

Resilient urban morphology to the flood risk in the final stretch of the Girona River (Alicante province)
José Sergio Palencia Jiménez, Eric Gielen, Yaiza Pérez Alonso
Topological analysis of contemporary morphologies under conflict: The urban transformation of Dobrinja in Sarajevo
Inés Aquilué, Estanislao Roca, Javier Ruiz

Building transformation in Bandung city centre: Expansion of land lot at Pasar Baru area
Soewarno Nurtati, Hidjaz Taufan, Virdianti Eka

Urban form in special geographical conditions: A case study in Kenting National Park
Chih-Hung Chen, Chun-Ya Chuang

Plastic City/Elastic City: A critical interpretation of urban transformations
Antonio Camporeale

Ruine and city: Procedure suggestion for the Imperial Forums of Rome
Valeria Marcenac, María José Ballester Bordes, Luis Bosch Roig, Carlos Campos González, Ignacio Bosch Reig

The role of residential fabric in the configuration of the city in Spain in the 1940s and 1950s. The case of Jaca
Raimundo Bambó Naya

Learning from Slussen: Place, idea and process in the transformation of central urban interstices
Álvaro Clua

The University-Residence Hall paradigm. Urban transformation of Alcalá de Henares in the Renaissance
Miguel Ángel Gil Campuzano, Maria Teresa Palomares Figueres

Arrival city: Refugees in three German cities
Hajo Neis, Briana Meier, Tomoki Furukawazono

Historic urban fabric as basis for further urban renewal: later 20th century public urban interventions in Ciutat Vella, Valencia
César Damián Mifsut García

Nowa Huta, Krakow, Poland. Old urbanism, new urbanism?
Anna Agata Kantarek, Ivor Samuels

The forming process of Fiumicino
Giuseppe Strappa, Marta Crognale

6. Cartography and big data

Exploring patterns of socio-spatial interaction in the public spaces of city through Big Data
Aminreza Iranmanesh, Resmiye A. Atun
Cartographying the real metropolis: A proposal for a data-based planning beyond the administrative boundaries
Juan R. Selva-Royo, Nuno Mardones, Alberto Cendoya

Morphological and functional attributes of preferred urban public spaces in Alicante province
Pablo Martí, Leticia Serrano-Estrada, Almudena Nolasco-Cirugeda

Urban form in the tourist cities of the coast of the Canary Islands. The morphologies of the leisure activities
Rafael R. Temes, Moisés Simancas, Alicia García, María Pilar Peñarrubia

Case study on emerging trends in geospatial technologies for study of urban form
Ming-Chun Lee

Because people act, cities can be smart: Promoting social innovation in smart-city design-tools in the Mediterranean
Carolina Mateo, Miriam Navarro, Begoña Serrano, Vera Valero

7. Tools of analysis in urban morphology

Medieval porticoes of Rome: Revealing Rome’s architectural and urban heritage digitally
Selena Kathleen Anders

The life-cycle of the city: a morphological perspective
Nicola Marzot

The effect of buildings on atmospheric turbulence in open spaces in Western São Paulo State, Brazil
Antonio Jaschke Machado

How to design the metro network for maximal accessibility potential? A comparative analysis of Shanghai
Lingzhu Zhang, Alain Chiaradia

Defining typological process in the transformation of Turkish house
Duygu Gokce, Fei Chen

Researching the morphology of the city’s internal micro structure: UPM Urban Parterre Modelling
Angelika Psenner, Klaus Kodydek

Morphological analysis of frontier villages in Cyprus
Erincik Edgü, Nevter Zafer Cömert, Nezire Özgece

What explains neighborhood type statistically? Morphological and spatial analytic approaches in urban morphology
Todor Stojanovski
Spatial processes of mass housing estates. Six case studies in Madrid
Sergio García-Pérez, Borja Ruiz-Apilánez Corrochano

Energy efficiency in the urban scale. Case study Prague, Czech Rep
Ernest Shtepani, Anna Yunitsyna

Recovering the habitat concept within urban morphology
Teresa Marat-Mendes, Maria Amélia Cabrita

The nine forms of the French Riviera: Classifying urban fabrics from the pedestrian perspective
Giovanni Fusco, Alessandro Araldi

Quantitative comparison of the distribution of densities in three Swedish cities
Meta Berghauser Pont, Gianna Stavroulaki, Kailun Sun, Ehsan Abshirini, Jesper Olsson, Lars Marcus

Typology based on three density variables central to Spacematrix using cluster analysis
Meta Berghauser Pont, Jesper Olsson

Perceptive approaches to the morphological characterization of the urban contour: The case of the peri-urban landscape of Madrid
J. Rodríguez Romero, Carlota Sáenz de Tejada Granados, Rocío Santo-Tomás Muro

Diachronic transformations of urban routes for the theory of attractors
Alessandro Camiz

A multidisciplinary approach to urban fabrics analysis. The historical centre of Valencia
Marco Maretto, Vicente Mas, Eva Alvarez, Barbara Gherri, Carlos Gomez, Maria Rosaria Guarini, Anthea Chiovitti, Gianluca Emmi

Location-based density and differentiation – adding attraction variables to Space Syntax
Lars Marcus, Meta Berghauser Pont, Gianna Stavroulaki, Jane Bobkova

Quantitative methods of urban morphology in urban design and environmental psychology
Irem Erin, Giovanni Fusco, Ebru Cubukcu, Alessandro Araldi

Spatial patterns in mass consumption: The fast food chain network and its street patterns, clusters and impact on street safety
Genevieve Shaun Lin, Kayvan Karimi

Visual analysis as a tool for urban intervention comparative studies
Ana Elena Builes, Leonardo Correa, Diana Carolina Gutiérrez

A study of Chinese traditional wetland island settlement combining morphological and narrative analyses
Dongxue Lei, Andong Lu
Identify urban spatial patterns based on the plot shapes and building setting in downtown of Nanjing
Yusheng Gu, Lian Tang, Wowo Ding

Towards new traditional urban fabrics: Learning from London
Mario Gallarati

The impact of a new transport system on the neighbourhoods surrounding the stations: The cases of Bermondsey and West Ham with the Jubilee Line extension in London
Po Nien Chen, Kayvan Karimi

Morphological analysis: to evaluate the pattern of residential building based on wind performance
Yihui Yang, Wei You, Yunlong Peng, Wowo Ding

A study on the history of urban morphology in China based on discourse analysis
Limeng Zhang, Andong Lu

Morpho-based study on urban street spatial configuration: The case of Nanjing city, China
Lian Tang, Jiaojiao Miao, Wowo Ding

Future scenario’s for post-industrial Eindhoven. A fringe-belt perspective
Daan Lammers, Ana Pereira Roders, Pieter van Wesemael

Urban landscape assessment
Vicente Collado Capilla, Sonia Gómez-Pardo Gabaldón

Towards the contemporary city. Reading method of post-unification restructuring of Trastevere in Rome
Giancarlo Salamone

Morphological evolution of the fringe-belts of Krasnoyarsk
